

Brainstorming & Ideation

Import Data using Transform Maps (Spreadsheet)

Field	Details
Date	30-09-2026
Team ID	6ab4dd3aa238dc999eb5dbda
Project Name	Import Data using Transform Maps (Spreadsheet)

Purpose

This phase defines the problem, objectives, proposed solution, project flow, and the supporting implementation evidence for importing employee data from a spreadsheet into ServiceNow.

1. Problem Statement

In enterprise environments, bulk employee and administrative records are often maintained in external spreadsheet formats such as Excel or CSV. Manually entering each record into ServiceNow is inefficient, labor-intensive, and can lead to data-entry errors, typos, and duplicate records.

The project addresses the need for a structured method to move employee data from a spreadsheet into ServiceNow while reducing repetitive manual entry and supporting consistent data handling.

2. Objectives

- Enable bulk employee data to be ingested from an external spreadsheet into ServiceNow.
- Use a staging area so imported spreadsheet data can be handled before reaching the target table.
- Map external spreadsheet headers to the target ServiceNow schema using Mapping Assist.
- Use Employee ID as the matching identifier through Coalesce so existing records can be updated instead of creating duplicates.
- Provide visual analytics through reports and an Employee Analytics Dashboard.

3. Proposed Solution

The proposed solution is an automated data-migration workflow that ingests bulk employee data from an external spreadsheet into a ServiceNow staging area. Mapping Assist aligns spreadsheet fields with the target production table, while Coalesce on Employee ID allows recurring uploads to identify existing employee records and update them instead of inserting duplicates.

4. Project Flow

External Spreadsheet → Staging u_employee_import → Transform Map (Sample Spreadsheet Import) → Target u_employee_test → Analytics Reports + Employee Analytics Dashboard

5. Implementation Evidence

The screenshots below are arranged in workflow order. Only the screenshots needed to explain the project setup and transformation flow are included.

Screenshot 1 Spreadsheet

	A	B	C	D	E	F	G	H	I	J	K	L
1	Employee ID	Name	Email	Department	Location							
2	SV001	User1	user1@gmail.com	Servicenow	Tamil Nadu							
3	SV002	User2	user2@gmail.com	Servicenow	Tamil Nadu							
4	SV003	User3	user3@gmail.com	Servicenow	Tamil Nadu							
5	SV004	User4	user4@gmail.com	Servicenow	Tamil Nadu							
6	SV005	User5	user5@gmail.com	Salesforce	Tamil Nadu

Screenshot 2 — Create Employee Import table

ServiceNow recommends creating custom tables in scoped applications. To learn more about creating scoped applications, click [here](#).

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More Info](#)

6. Expected Outcome

The workflow provides a structured path from the external spreadsheet to the ServiceNow target table, with field mapping and Employee ID-based Coalesce supporting consistent imports and avoiding duplicate employee records. The imported data can then be represented through reports and an Employee Analytics Dashboard.
