

Requirement Analysis

Import Data using Transform Maps (Spreadsheet)

Field	Details
Date	30-09-2026
Team ID	6ab4dd3aa238dc999eb5dbda
Project Name	Import Data using Transform Maps (Spreadsheet)

Scope

This phase documents the functional and non-functional expectations, environment requirements, use-case flow, and implementation evidence for the spreadsheet-to-ServiceNow import workflow.

1. Functional Requirements

- The system shall accept employee data from a spreadsheet containing Employee ID, Name, Email, Department, and Location.
- The system shall load spreadsheet data into the staging/import table u_employee_import.
- The system shall use the Transform Map named Sample Spreadsheet Import to transfer data from the staging table to the target table.
- The system shall map Employee ID, Name, Email, Department, and Location from source fields to the corresponding target fields.
- The system shall use Employee ID as the Coalesce field so that an existing employee record can be identified during repeated imports.
- The system shall support the project dataset of 15 employee records.
- The system shall support visual reporting through Employees by Department, Employees by Location, and Employee List reports.
- The system shall provide an Employee Analytics Dashboard using the imported employee data.

2. Documented Data Fields

Source / Business Field	Purpose
Employee ID	Unique employee identifier and Coalesce field
Name	Employee name
Email	Employee email address
Department	Employee department
Location	Employee location

3. Non-Functional Requirements

- Data integrity: Employee ID is used with Coalesce to avoid duplicate employee records during repeated imports.
- Consistency: Source spreadsheet fields must correspond to the defined employee data model and target fields.
- Usability: The workflow is intended to reduce repetitive manual entry by using spreadsheet import, mapping, and transformation.
- Traceability: Import Set and Transform Map stages provide a structured path from source data to the target employee table.
- Reporting accessibility: Imported data should be available for the specified reports and Employee Analytics Dashboard.

4. Hardware / Software Requirements

Software / Environment	Requirement
Platform	ServiceNow Personal Developer Instance (PDI)
Input Data	Google Sheets or Microsoft Excel
Access	Web browser
Version / Collaboration	GitHub is listed in the project requirements

5. Use Case Flow

Project Team: Prepare employee spreadsheet → Load spreadsheet into ServiceNow → Generate reports and dashboard

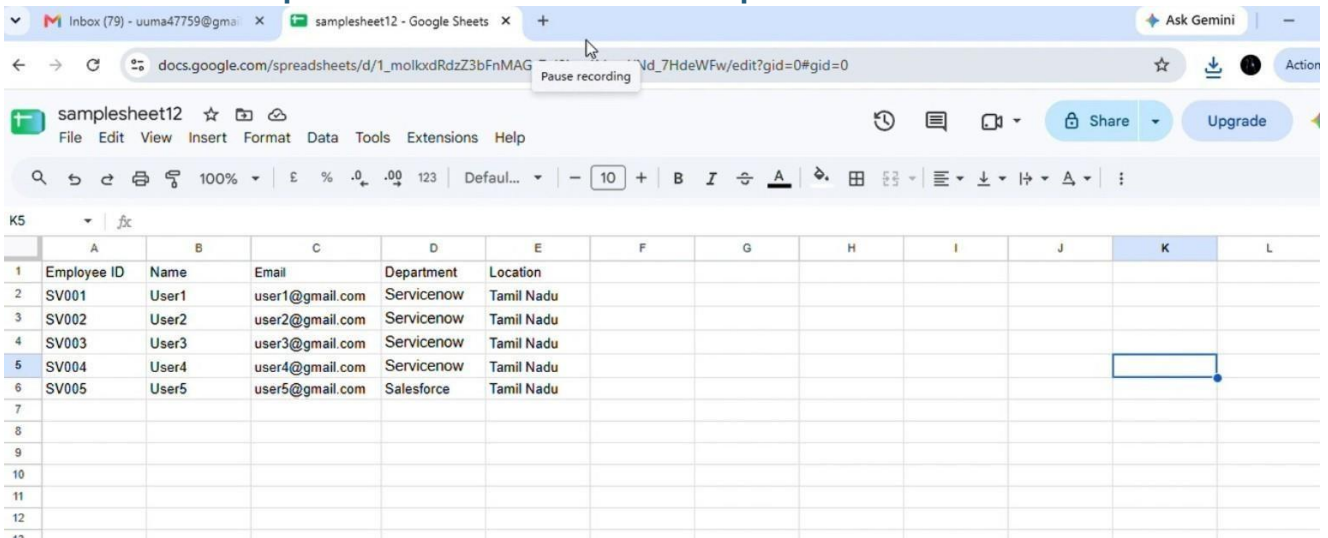

ServiceNow: Create / use staging table → Map source fields to target fields → Apply Coalesce using Employee ID → Transform data into Employee Test table

Overall flow: Spreadsheet → Import Set / Staging → Transform Map → Employee Test target table → Reports / Dashboard.

6. Project Screenshots

The screenshots are arranged in the order that the requirements are implemented. Duplicate or navigationonly screenshots have been omitted.

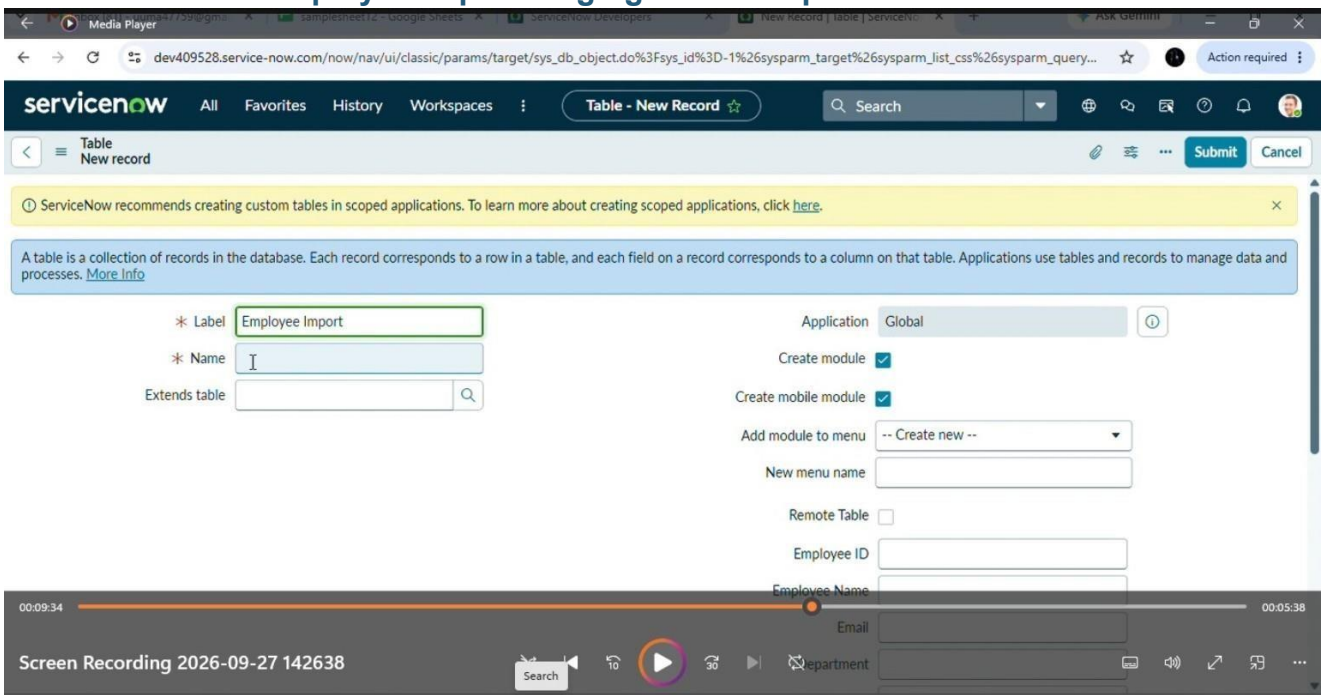

Screenshot 1 — Spreadsheet file used as the import source

Employee ID	Name	Email	Department	Location
SV001	User1	user1@gmail.com	Servicenow	Tamil Nadu
SV002	User2	user2@gmail.com	Servicenow	Tamil Nadu
SV003	User3	user3@gmail.com	Servicenow	Tamil Nadu
SV004	User4	user4@gmail.com	Servicenow	Tamil Nadu
SV005	User5	user5@gmail.com	Salesforce	Tamil Nadu

Screenshot 2 — Employee Import staging table setup

ServiceNow recommends creating custom tables in scoped applications. To learn more about creating scoped applications, click [here](#).

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More Info](#)
