Project Name	Import Data using Transform Maps (Spreadsheet)

Demonstration of the complete ServiceNow spreadsheet import workflow

Phase 8 – Demonstration

Project Overview

This project demonstrates how employee data from a spreadsheet can be imported into ServiceNow using Import Sets and Transform Maps. The project maps spreadsheet fields to the target employee table, uses Employee ID with Coalesce to handle existing records, and presents the processed data through reports and an Employee Analytics Dashboard.

Demo Steps

1. Open the ServiceNow PDI and show the employee import setup used for the project.
2. Show the source spreadsheet containing Employee ID, Name, Email, Department, and Location fields.
3. Show the **u_employee_import** staging table and the **Sample Spreadsheet Import** Transform Map.
4. Show the field mappings and confirm that Employee ID is used with **Coalesce**.
5. Run the transformation and show the processed records in the **u_employee_test** target table.
6. Show the Transform History/results and verify the import status and processed records.
7. Show the **Employees by Department**, **Employees by Location**, and **Employee List** reports.
8. Open the **Employee Analytics Dashboard** and show the consolidated reports and visualizations.

Conclusion

The demonstration presents the complete workflow from spreadsheet data preparation to import, transformation, validation, reporting, and dashboard visualization in ServiceNow. The

project provides a structured method for handling employee data imports and maintaining data consistency through Employee ID-based Coalesce.
